

OFFICIAL PROJECT DOCUMENTATION

ROAD MAP

Four phases from a secure Solana launch to a full AI intelligence ecosystem. Here is exactly how Meme Bull gets built, in order, with the milestones, metrics and reasoning behind each one.

10 Closing Statement 12

01 — VISION & APPROACH

Building in the open, one phase at a time

Meme Bull is not launching as a finished product. It is launching as a foundation, with a clear and public plan for how the token, the community and the AI intelligence engine grow together over the year ahead.

The roadmap that follows is organized into four phases. Each phase has a clear objective: get the foundation right, prove early traction, expand the intelligence engine into something people rely on daily, and finally mature the ecosystem into a self sustaining, community governed platform. Timelines are directional and may shift as development and market conditions require, but the sequence and the underlying priorities do not.

We are publishing this level of detail deliberately. A roadmap that only lists vague future ambitions is easy to write and impossible to hold anyone accountable to. Every milestone below is written to be specific enough that the community can check, at any point, whether it has actually happened.

Q1 **Foundation**

Q2 **Ignition**

Q3 **Expansion**

Q4+ **Maturity**

Every milestone referenced across the four phases will be tracked and updated publicly through official Meme Bull community channels as it is delivered, so holders always know exactly where the project stands.

02 — HOW TO READ THIS ROADMAP

What each phase page actually promises

Each phase in this document is broken down the same way, so that the roadmap is easy to audit rather than just easy to read. Before diving into the four phases, it is worth being explicit about what each part of a phase page means.

The Objective

A single sentence describing what the phase is actually trying to achieve, independent of the specific tasks underneath it. If every milestone in a phase shipped except one, the objective tells you whether the phase still succeeded in spirit.

The Milestones

Specific, checkable deliverables. Each one is written so that it is either clearly done or clearly not done, rather than left open to interpretation.

Dependencies

Where relevant, a note on what has to be true before a milestone can start, so the sequencing between phases is transparent rather than arbitrary.

Section 7 of this document also summarizes the success metrics the team will use to judge whether a phase actually landed, and Section 8 is honest about the specific risks that could push any of these timelines.

01 QUARTER ONE

Foundation & Ignition

OBJECTIVE

Ship a secure, fairly launched foundation that the community can independently verify, before turning attention to growth of any kind.

- Finalize brand identity, official website and full documentation suite, including this roadmap and the companion whitepaper.
- Complete smart contract development and commission a third party audit on Solana, publishing the full report regardless of outcome.
- Open official Telegram, X and Discord channels, with clear moderation guidelines published from day one.
- Execute fair launch with no private presale and no seed round pricing advantage for any group.
- Fund and lock liquidity pool for a minimum term of twelve months, with the locking transaction published for public verification.
- Renounce contract ownership once initial launch parameters are confirmed stable on chain.
- Publish the treasury multi signature wallet address and initial signer set for public transparency.

Dependency. Nothing in later phases begins in earnest until the audit is complete and the liquidity pool is locked. This phase is treated as a hard gate, not a soft target.

02 QUARTER TWO

Growth & Market Presence

OBJECTIVE

Establish visibility and credibility in the wider market, and ship the first real, usable version of the AI intelligence engine.

- Secure initial decentralized exchange listing and grow organic trading volume through community and content driven activity.
- List on CoinMarketCap and CoinGecko for tracking, price discovery and wider ecosystem visibility.
- Ship the Meme Bull AI engine alpha, including a live sentiment dashboard covering major and emerging assets.
- Launch structured influencer and community growth campaigns across major social platforms, with clearly disclosed partnerships.
- Submit the first tier two centralized exchange listing application, and publish progress updates as the process advances.
- Grow the holder base and daily active community engagement, tracked and reported against the metrics defined in Section 7.
- Open the first cohort of the ambassador program described in the companion whitepaper.

Dependency: Builds directly on the audited, launched foundation from Phase One. The AI engine alpha uses the ingestion and processing pipeline architecture defined in the whitepaper, refined against real launch data.

03 QUARTER THREE

Platform Expansion

OBJECTIVE

Turn the AI engine into a full product suite, and give $MBULL holders concrete, ongoing reasons to stake and stay engaged.

- Launch public beta of the narrative tracker and prediction markets radar modules, open to all $MBULL holders.
- Open the staking platform for $MBULL holders with tiered reward rates weighted toward longer commitment periods.
- Form strategic partnerships with data, analytics and research platforms to widen the intelligence engine's source coverage.
- Pursue additional tier two and begin conversations for tier one centralized exchange listings.
- Begin development of the Meme Bull mobile application, targeting a native experience for alerts and dashboards.
- Introduce the research assistant in limited early access to a rotating cohort of engaged community members.
- Publish the first quarterly transparency report covering treasury activity, audit follow ups and roadmap progress against Section 7 metrics.

Dependency: Staking mechanics depend on the tokenomics vesting schedule defined in the whitepaper being fully in effect, and the narrative tracker beta depends on data volume gathered during Phase Two.

04 QUARTER FOUR & BEYOND

Ecosystem Maturity

OBJECTIVE

Shift Meme Bull from a team led project to a community governed ecosystem, with the full intelligence suite live for every holder.

- Launch the full AI intelligence suite: smart alerts, research assistant and prediction markets module, unified into one experience.
- Introduce the DAO governance framework for treasury allocation and roadmap decisions, with voting weight tied to staked holdings.
- Pursue tier one global exchange listings, building on relationships established in Phase Three.
- Expand marketing and partnerships beyond the initial core markets into new regions and language communities.
- Ship continuous AI model upgrades based on real usage data gathered across the previous three phases.
- Open community governed voting on future roadmap priorities, formalizing the informal feedback loops used in earlier phases.
- Publish an annual transparency report summarizing treasury activity, governance votes and platform usage across the full year.

Dependency: The DAO framework depends on the governance groundwork described in the whitepaper, and on a treasury with a proven, publicly reported track record from the quarterly reports in Phase Three.

07 — SUCCESS METRICS BY PHASE

How we will judge our own progress

A roadmap is only useful if there is an honest way to check whether it actually happened. The table below lists the concrete markers the team will use, and will publish updates against, to judge whether each phase genuinely landed rather than simply being declared complete.

PHASE	WHAT "DONE" LOOKS LIKE
Phase 01	Audit published, liquidity locked and verifiable on chain, contract ownership renounced, community channels active with published moderation guidelines.
Phase 02	Live on at least one DEX and both major tracking sites, AI engine alpha shipped and usable, first tier two exchange application submitted, holder base and engagement trending upward against published baselines.
Phase 03	Staking platform live with real participation, narrative tracker and prediction radar in public beta, at least one data or analytics partnership signed, first quarterly transparency report published on schedule.
Phase 04	Full intelligence suite live for all holders, DAO framework operational with at least one completed governance vote, tier one listing progress reported, annual transparency report published.

These metrics will be reported through the quarterly and annual transparency reports referenced in Phases Three and Four, and will be visible in community channels well before each formal report is published.

08 — RISKS TO THE TIMELINE

Being honest about what could shift this

Every roadmap is a statement of intent, not a contractual guarantee. The factors below are the most likely sources of delay or adjustment, disclosed here directly rather than left for the community to discover only if they happen.

RISK	DESCRIPTION
Market Conditions	A prolonged downturn across crypto markets can slow trading volume, liquidity and the pace at which exchange listings and partnerships come together, independent of Meme Bull's own execution.
Exchange Listing Timelines	Centralized exchange listing processes are ultimately controlled by the exchanges themselves, and can take longer than anticipated regardless of how complete an application is.
AI Model Development	Sentiment, narrative and prediction models improve with more real data and iteration. Some features may launch in a narrower beta form before widening, rather than fully formed on the first try.
Regulatory Developments	Changes in how different jurisdictions treat digital assets or AI powered financial tooling could require adjustments to how certain features are offered in certain regions.
Team Capacity	As with any small, focused team, prioritization decisions may shift resources between milestones within a phase to protect the phase's core objective, even if a specific secondary item slips.

Where any of these factors materially affect a milestone, the change and the reasoning behind it will be communicated through official channels before the affected date, not after it has quietly passed. The full risk disclosure in the companion whitepaper covers risks to the token and platform more broadly.

09 — BEYOND PHASE 04

What happens after the roadmap ends

This document deliberately does not attempt to plan multiple years into the future in specific detail. Once the DAO framework in Phase Four is live, the direction of the project increasingly becomes a decision the community makes together rather than one the founding team makes alone.

- Continued expansion of data sources feeding the intelligence engine, including deeper coverage of prediction markets and political developments.
- Exploration of a developer facing API and data marketplace, letting third party teams build on top of Meme Bull's intelligence layer.
- Ongoing community governed prioritization of new modules, voted on through the DAO framework established in Phase Four.
- Ongoing exchange and partnership expansion beyond the initial target list, guided by where the community and usage data indicate demand.

What can be said with confidence is the shape of the trajectory: from a secure, fairly launched foundation, to a proven product with real usage, to a fully community governed ecosystem. Everything beyond that point is, by design, for the community to decide.

10 — CLOSING STATEMENT

A roadmap is a promise made in public. We plan to keep ours in full view, one shipped milestone at a time.

Timelines above are directional and may adjust as the team responds to development realities and market conditions, but the sequence and the underlying priorities remain fixed. For the latest milestone status, follow the official Meme Bull community channels and read the companion whitepaper for the full picture of the token, the platform and the reasoning behind them.
